

### Example 4 Application Problem

You are in a hot air balloon 600 ft off the ground where you can see your friend. If the angle from your line of sight to your friend is  $20^\circ$ , how far is he from the point on the ground directly below the balloon?

## Solving Right Triangles

To solve a right triangle means...

Triangle Sum Theorem:

Pythagorean Theorem:

Sketch the right triangle.

$$m\angle A = a = 8$$

$$m\angle B = b =$$

$$m\angle C = c = 14$$

**Example 3** Solve the triangle given two sides

Use an inverse trig ratio to find a missing angle.

Use the Triangle Sum Theorem to find the missing angle.

Use the Pythagorean Theorem to find third side.

### Example 1 Find the trig ratio for $\theta$

Given the hypotenuse and a side

Find  $\cos \theta$ .

opp=

adj=

hyp=

Given two sides

Find  $\sin \theta$ .

opp=

adj=

hyp=

**Example 2** Solve the triangle given an angle and a side

Sketch the right triangle.

$$m\angle A = a =$$

$$m\angle B = 49^\circ$$

$$m\angle C = c = 7$$

Use the Triangle Sum Theorem to find the missing angle.

Use a trig ratio to find a missing side.

Use the Pythagorean Theorem to find third side.
